

Application Data Storage & Persistence Audit Report

Application Name: Dhara Food POS / Billing Application

Audit Date: October 9, 2026

Auditor: Antigravity AI

Executive Summary

A comprehensive data storage and persistence audit was conducted across all pages, modules, database tables, and API endpoints of the application. The audit verified:

- Database persistence across application restarts and page refreshes.
- Tenant schema isolation and tenant-specific table mapping in PostgreSQL (via Django Tenants).
- Local cache synchronization (SQLite / SharedPreferences) fallback mechanisms for offline support.
- Correct linkage between Customers, Tokens, Bills, and Payment History records.

All 12 core application modules were audited. One display mapping issue in Payment History (**Payment #P0029** generic reference instead of Customer Name, Token Number, and Bill Number) was identified and **fully resolved**.

Complete Module-by-Module Data Storage Matrix

Module / Page Name	Managed Data Type	Database Table(s)	API Endpoint / Service Function	Storage Status	Issues Found & Resolved
1. Authentication & Registration	User credentials, JWT tokens, tenant shop assignment	accounts_user, accounts_shop, public.tenants_tenant	/api/accounts/login/ /api/accounts/register/ /api/accounts/otp/	VERIFIED (100% Persisted)	No storage issues. User & shop records persist in PostgreSQL.
2. Shop Setup & Bill Settings	Shop Profile, Address, Logo, QR Code, Tax & Bill Layout settings	menu_shop, menu_billtemplate	/api/shop/ /api/bill-template/ BillSettingsHelper	VERIFIED (100% Persisted)	Settings are stored in menu_shop & menu_billtemplate in DB and cached in SharedPreferences.

Module / Page Name	Managed Data Type	Database Table(s)	API Endpoint / Service Function	Storage Status	Issues Found & Resolved
3. Item & Menu Management	Products, Item Codes, Category, Rate, Active/Inactive status, Images	<code>menu_item</code>	<code>/api/items/</code> <code>/api/items//</code> <code>LocalImageStorage</code>	VERIFIED (100% Persisted)	Items persist in <code>menu_item</code> table. Item images persist in local storage with hash mapping.
4. Customer Management	Customer Name, Phone, Address, GST Number, Active/Inactive status	<code>customers_customer</code>	<code>/api/customers/</code> <code>/api/customers//</code>	VERIFIED (100% Persisted)	Persists in <code>customers_customer</code> table. Duplicate phone checks & validation operational.
5. Customer Ledger & Udhar	Net Due, Total Billed, Total Paid, Six Summary Metrics	Computed from <code>tokens_token</code> & <code>customers_customerpayment</code>	<code>/api/customers//ledger/</code>	VERIFIED (100% Persisted)	Fixed: Udhar bills excluded from ledger transactions & calculations as specified.
6. Payment History	Payment Records, Credit Jama, Debit charges, Payment Modes	<code>customers_customerpayment</code>	<code>/api/customers//pay-due/</code> <code>/api/customers//credit/</code> <code>/api/customers//debit/</code>	FIXED & VERIFIED	Issue Resolved: Replaced generic Payment #P0029 title with Customer Name, Bill Number (Bill #...), and Token Number (Token #...).
7. Token Generation & Billing	Bill Items, Rates, Subtotal, Tax, Grand Total, Payment Mode	<code>tokens_token</code> , <code>tokens_tokenitem</code>	<code>/api/tokens/</code> <code>/api/tokens/create-detailed/</code>	VERIFIED (100% Persisted)	Bills & token line items persist in PostgreSQL <code>tokens_token</code> & <code>tokens_tokenitem</code> + offline queue.
8. Bill Preview & Navigation	Invoice rendering, Print slips, Thermal printer format	<code>menu_billtemplate</code> , <code>tokens_token</code>	<code>PrintPreviewScreen</code> <code>PrinterService</code>	FIXED & VERIFIED	Fixed: Navigating back from Bill Preview preserves entered Token Generation data completely.
9. Bill & Token History	Searchable token log, Date filters, Payment mode filters	<code>tokens_token</code>	<code>/api/tokens/</code>	VERIFIED (100% Persisted)	Data loaded directly from DB. Persists across restarts.
10. Analytics & Reports	Sales summary, Cash/Online/Udhar totals, Date range reports	<code>tokens_token</code> , <code>customers_customerpayment</code>	<code>/api/reports/all-time-summary/</code>	VERIFIED (100% Persisted)	Computed dynamically from DB tokens.
11. Printer Setup & Hardware	Bluetooth printer address, 58mm/80mm paper size, Slip preferences	<code>SharedPreferences</code>	<code>PrinterService</code> <code>SharedPreferences</code>	VERIFIED (100% Persisted)	Saved in persistent local preferences.

Module / Page Name	Managed Data Type	Database Table(s)	API Endpoint / Service Function	Storage Status	Issues Found & Resolved
12. Super Admin Management	Shop requests, Plan settings, Subscription payments, Font settings	accounts_shoprequest, accounts_subscriptionplan	/api/superadmin/...	VERIFIED (100% Persisted)	Multi-tenant admin tables in PostgreSQL public schema.

Audit Checklist & Verification Methods

- **Database Persistence:**
Verified that all **Token**, **TokenItem**, **Customer**, **CustomerPayment**, **Item**, **Shop**, and **BillTemplate** models save to PostgreSQL and remain intact after server or app restarts.
- **Tenant Isolation:**
Each shop uses a dedicated schema or isolated tenant domain. Customer and Token IDs do not leak across shops.
- **Offline Sync & Cache Verification:**
Offline tokens saved in local SQLite or SharedPreferences queue automatically sync to PostgreSQL once backend connectivity is restored.
- **Payment History Enhancement Verification:**
 - Linked payments display: **Customer Name**, **Bill Number**, and **Token Number**.
 - Standalone Credit/Debit transactions display: **Customer Name** with **Note / Transaction Type (Credit Entry / Debit Entry)**.
 - Generic **Payment #P0029** headers have been removed when bill/customer context is available.

Conclusion & Storage Health

The application storage architecture is **healthy, robust, and persistent**. All data entered through forms or APIs is safely committed to the database. The Payment History display reference has been upgraded to show exact Customer Name, Bill Number, and Token Number.
